IN THE CLAIMS:

- 1. An object oriented computing system on a computer platform, comprising: objects with semanticless, dynamically likable inputs and outputs; and an event communication framework providing automated, pattern-based, fully distributable events.
- 2. The object oriented computing system of claim 1, wherein the inputs and outputs of the objects are provided via CsaConnectable and CsaRemote objects, respectively.
- 3. The object oriented computing system of claim 2, wherein each data structure associated with the inputs and outputs is described in a separate header file which can be used by every object to be linked.
- 4. The object oriented computing system of claim 2, wherein each object is a shared library which is dynamically likable at runtime by an ASCII configuration filing names of the inputs and outputs of the objects.
- 5. An object oriented computing system on a computing system, comprising: objects having dynamically likable inputs and outputs and internal tasks for queuing of data transferred into and out from the objects via said inputs and outputs, respectively; and

an event communication framework providing automated, pattern-based, fully distributable events.

- 6. The object oriented computing system of claim 5, wherein the inputs and outputs of the objects are provided via CsaConnectable and CsaRemote objects, respectively.
- 7. The object oriented computing system of claim 6, wherein each data structure associated with the inputs and outputs is described in a separate header file which can be used by every object to be linked.

- 8. The object oriented computing system of claim 6, wherein each object is a shared library which is dynamically linkable at runtime by an ASCII configuration file containing names of the inputs and outputs of the objects.
- 9. A method for designing software components in an object oriented computing system, comprising the steps of:

defining input and output events that are fully distributable;

configuring dynamic linkable, semantic-free software components by input and output connections points; and

providing autorouted pattern based fully distributable events based on an event communication framework.

10. A storage medium including object oriented code having an object oriented computing system on a computer platform, comprising:

objects with semanticless, dynamically linkable inputs and outputs; and an event communication framework providing automated, pattern-based, fully distributable events.

- 11. The storage medium of claim 10, wherein the inputs and outputs of the objects are provided via CsaConnectable and CsaRemote objects, respectively.
- 12. The storage medium of claim 11, wherein each data structure associated with the inputs and outputs is described in a separate header file which can be used by every object to be linked.
- 13. The storage medium of claim 11, wherein each object is a shared library which is dynamically likable at runtime by an ASCII configuration filing names of the inputs and outputs of the objects.
 - 14. A storage medium, comprising:

object oriented code for an object oriented computing system on a computing system; objects having dynamically linkable inputs and outputs and internal tasks for queuing of data transferred into and out from the objects via said inputs and outputs, respectively; and

an event communication framework providing automated, pattern-based, fully distributable events.

- 15. The storage medium of claim 14, wherein the inputs and outputs of the objects are provided via CsaConnectable and CsaRemote objects, respectively.
- 16. The storage medium of claim 15, wherein each data structure associated with the inputs and outputs is described in a separate header file which can be used by every object to be linked.
- 17. The storage medium of claim 15, wherein each object is a shared library which is dynamically linkable at runtime by an ASCII configuration file containing names of the inputs and outputs of the objects.
- 18. A method for designing software components in an object oriented computing system having a storage medium including object oriented code, comprising the steps of: defining input and output events that are fully distributable;

configuring dynamic linkable, semantic-free software components by input and output connections points; and

providing autorouted pattern based fully distributable events based on an event communication framework.
